       hour <dbl>, minute <dbl>, time_hour <dttm>
```

2) Another useful dplyr filtering helper is between(). What does it do? Can you use it to simplify the code needed to answer the previous challenges.

```
# the expression between(x, left, right) is the same as saying that x \ge left & x \le right.
# therefore, for the question that flights that departed during the summer, it can be rewritten in this filter(flights, between(month, 7, 9))
```

```

5.3.1 Exercises

1) How could you use arrange() to sort all missing values to the start? (Hint: use is.na()).

```
# what the arrange() functions does is it puts NA values last.
# instead to put th NA first, we can add something that checks if the column is missing a value.
arrange(flights, desc(is.na(dep_time)), dep_time)
```

```
## # A tibble: 336,776 x 19
